About Me

I am a philosopher-turned-engineer who builds digital solutions that solve real-world problems. I specialize in creating intelligent web applications using Python, Go, and React, with a focus on AI-augmented workflows that accelerate development.

My approach combines deep technical expertise with a problem-solver's mindset. I don't just write code — I build systems that empower users, streamline operations, and create measurable impact. My current focus is on AI-driven tools for agriculture, helping small-scale farmers access critical information through intuitive technology.

I am actively seeking **collaborations** with innovative teams and **sponsors** who are building products that matter. Whether it's a startup looking for a technical co-founder or an established company wanting to integrate AI into their workflow, I bring both the vision and the execution to make it happen.

 Currently

- Building **Plant Assistant** — an AI tool for small-scale farmers
- Learning advanced Go patterns and distributed systems
- Open to collaborating on impactful agri-tech and AI projects

Let's build something that changes the game.
